

ECL Embedded Development Services

Embedded Java Benchmark Suite
Information Application Benchmark Suite
Boards, Firmware, Software, Documentation
Embedded Real-Time Operating Systems (RTOS's)
EEMBC™ - Embedded Microprocessor Benchmark Consortium
Development of Industry-Standard Benchmark and Compliance Suites

Developing Products

ECL's extensive experience in embedded tools, architectures, and analysis, provides you with a unique opportunity to hire us for specific development projects. ECL's unique syndicate of talented engineers, developers, and technical writers stand ready to work with you to bring your product idea to market, or upgrade your existing product.

Our people are carefully managed by ECL's most senior staff to assure 100% client satisfaction and schedule attainment.

Whether it is a new board, firmware, middleware/API's, software, documentation, or test suites, ECL knows how to get the job done right, the first time. We should - we have lead the charge in software engineering techniques for over 20 years!

Consortium Consultation

ECL personnel have been involved with EEMBC, SPEC, BAPCo, and other industry standards initiatives. If you are starting a group, or need advice on an existing consortium, or industry-standards organization, let ECL provide sage, time-tested advice on such matters as legal and accounting council selection, by-law creation, organization structure, logistics, marketing and promotion, or forming alliances within or across industries.

Industry- Standard Benchmark and Compliance Suites

ECL, the EEMBC Certification Laboratories, was chosen as the certification laboratory of EEMBC (Embedded Microprocessor Benchmark Consortium). For four years ECL has been unanimously accorded this status, earned each day with our work. ECL is also the leader of EEMBC's Technical Advisory Board (TechTAG), and has been chartered with developing all future EEMBC benchmark suites.

In addition to bringing EEMBC Release 1 to the industry, ECL architected and created the 8 and 16 Bit Benchmark Suite, and is hard at work on the Java Benchmark Suite for EEMBC.

ECL's talents are more than just engineering, though. Listening to consortium and committee members, adjudicating differences of opinions, creating win-win environments--that is what sets ECL apart from the competition. This ability to work with partners, customers, and other teamed-up companies means better efficiency, better quality-- on schedule.

ECL is working closely with select information appliance vendors to create the next certified industry-standard benchmark suite for these important new consumer products.

ECL's engineers have vast experience testing Unix, Windows NT, Linux, and of course dozens of embedded RTOS's and compilers. Our Compliance Test team works with existing experts in the field, and fills in the gaps where needed. Then ECL's certification system assures fair, honest, above-board verification.
